

Shapes

By Sandy Kemsley

There are many shapes. A circle is round. 

A triangle  has three sides. A square  and a rectangle  have four sides. Can you draw a circle? Can you draw a triangle? How many sides did you draw?

There are other shapes that are fun to learn about. If a shape has five sides it is called a pentagon. 

There is a building in Washington D.C. that is called the Pentagon because it has five sides. A shape that has six sides is called a hexagon. This is a little harder to draw. 

There is another shape you probably see every day. It has eight sides. It is an octagon.

Do you know what you see each day that is an octagon? Right! It is a stop sign! Look around your room. What shapes do you see?

Draw each of the following

Circle	Triangle
Square	Rectangle
Pentagon	Hexagon
Octagon	Draw a picture using different shapes
