You will need:

Alligator Life Cycle printout
Alligator Life Cycle Diagram printout
scissors
glue

Read the **Alligator Life Cycle**. Cut out the pictures below. Match the pictures to the words on the next page. Glue the pictures in place.

Alligator Life Cycle

An alligator goes through different stages during its life. It begins life developing inside an egg. The egg hatches and a baby alligator comes out. The baby alligator is just like an adult alligator, only smaller. The baby alligator grows into an adult. An adult female alligator lays eggs in a nest of mud and leaves. If the temperature of the nest is above about 90 degrees, all the eggs will hatch as male alligators. If the temperature is below 90 degrees, all the eggs will hatch as female alligators.
