

## FIRE!

Every year thousands of people die in fires. They die from being burned, and they die from breathing in smoke. More people die in the United States from fires than from any other natural disaster. Most of those fires are “home fires” – fires that are started inside the home. Most home fires are caused by cigarettes. Many other home fires start in the kitchen.

It is possible to prevent almost all home fires from being deadly, just by following a few simple rules.

1. Nobody should smoke in the house; or, if they do, they should be absolutely certain that every cigarette and all the ashes are *extinguished* (put out).
2. Food that is cooking should be carefully watched. Food should never be left cooking on the stove top.
3. Every home should have smoke alarms and fire extinguishers or automatic sprinklers.
4. Everybody in the home should know basic fire safety.

**ANSWERS TO *FIRE!***

1. a
2. c
3. c (it is not D, because *having* an extinguisher does not *prevent* the fire).
